

DeepX, Inc.

Company Description

Automating Any Machine and Innovating Global Industries

— DeepX automates any machine using AI to solve real world issues.

DeepX is a startup company located in Tokyo, Japan, that automates heavy equipment machinery. Our notable successes include the automation of point-to-point operations of a mobile crane in cooperation with Tadano, one of the largest manufacturers of mobile cranes in Japan, and the automation of an excavator in cooperation with Fujita, one of the major general constructors. As such, we are addressing the problem of labor shortage, which is one of the most severe challenges in Japan.

DeepX is highly international, hosting engineers from both Japan and all over the world. Regular team and social events contribute to the collaborative atmosphere of the company. We welcome individuals who are innovative, dynamic and ready to take on challenges in the realm of automation technology.
