

Recovery Pro

Company Description

Recovery Pro Co., Ltd. is a group of professionals specializing in the rapid restoration of businesses and facilities affected by disasters such as fires and floods. As a wholly-owned subsidiary of BELFOR, the world's largest disaster restoration company with operations in over 55 countries and a track record of approximately 95,000 restorations annually, it applies BELFOR's advanced technologies and global expertise to the Japanese market.

The company's core business is "disaster early recovery service," aiming to restore buildings and machinery to their pre-disaster condition. For building restoration, they provide a comprehensive range of services from removing soot and hazardous substance contamination caused by fires to interior repair, cleaning, deodorization, and demolition. For machinery and equipment, they perform highly technical tasks, including emergency measures for corrosion inhibition, precision cleaning of substrates, repair, and rust removal. Furthermore, they offer a "document restoration service" to fully dry and restore important water-damaged documents and books to a readable state.

More than just a repair contractor, the company's top priority is to help customers resume their operations as quickly as possible through swift assessments and the proposal of optimal restoration plans. By partnering with major non-life insurance companies in Japan, they have built a stable business foundation and established a unique business model that does not require sales-oriented activities.

The company's strength lies in its high level of specialization and technical expertise. Its employees hold a variety of professional qualifications, including First-Class Architects, Architectural Construction Managers, Electricians, and Hazardous Materials Handlers, enabling them to respond immediately to any disaster site. This ensures that they can provide high-quality restoration services even in complex disaster situations. Although the company's business is still in its early stages of widespread adoption in Japan, it is a field with high global demand and promising stable growth.
