Minimum Experience Level

Over 6 years

Career Level

Mid Career

Minimum English Level

Daily Conversation

Minimum Japanese Level

Business Level

Minimum Education Level

Bachelor's Degree

Visa Status

Permission to work in Japan required

Job Description

Advances in embedded hardware and operating systems bring real-time 3D to pixels on every screen. Users will expect stunning interactive experiences everywhere: from in-car infotainment systems and digital cockpits to touch-screen kiosks in showrooms and at sporting events. Unity is at the forefront with our scalable, performant runtime engine and Unity Editor workflow.

We are looking for a senior software engineer to join our growing team. The team builds and maintains our platform support for Embedded Linux (e.g. Yocto), QNX and Android solutions. As experiences evolve to include multiple screens, layering of 3D content with other applications and rich multi-touch input, our platform grows to match expectations.

Unity is committed to solving the hardest technical challenges, and this role plays a key part in delivering industry solutions for our customers.

You will work with teams across Unity, including industry teams who work directly with customers and R&D teams responsible for cross-platform support, systems architecture, libraries, as well as runtime optimization. Complementary to the

engine platform work you will help Unity provide Embedded Support for our premium customers, e.g. in the automotive industry.

Required Skills

What you'll be doing

- Extend Unity platform capabilities to include targeted hardware and operating systems used within industry verticals
- Develop integrations with applications, development frameworks and libraries to support industry verticals
- Work directly with our customers on investigating and fixing bugs as well as evaluating performance bottlenecks to ensure they are set up for success
- Focus in on key performance areas, such as improving build time, load time and iteration time across platforms
- Collaborate with other team members to ensure high quality code through code reviews and writing automated tests

What we're looking for

- Proven ability to design, implement and debug scalable feature sets in a large multithreaded C/C++/C# codebase on Linux
- Familiarity with rendering stacks such as OpenGL or Vulkan
- Proficiency with platform profiling tools (CPU/GPU/IO)
- Familiarity with Real Time 3D, UI systems and services
- Experience working in direct contact with customers (business proficiency in Japanese and English required)

You might also have

- Previous experience with embedded engineering (e.g. creating HMIs and Instrument clusters)
- Experience with Operating Systems used in Automotive such as AGL and Yocto Linux or AOSP/AAOS and familiarity with the Android lifecycle
- Knowledge of e-Linux and RTOS systems (e.g. QNX, Integrity) as well as Automotive SoCs, such as Qualcomm SA8155, NXP i.MX8 or Nvidia Jetson

Additional information

- Relocation support is not available for this position.
 - International relocation support is not available for this position.
 - Work visa/immigration sponsorship is not available for this position.
